ABSTRACT
This study aims to investigate the process of fostering inclusivity for children with autism spectrum disorder (ASD) within educational contexts, with a specific focus on understanding the efficacy of Applied Behavior Analysis (ABA) and Assessment of Basic Language and Learning Skills (ABLLS) programs. It draws from experiences gained through collaboration with professionals and parents at the Princesse Lalla Meryem Pour Enfants Autistes Institute in Tangier. Set within the dynamic landscape of Morocco’s disability support and education sector, this research unfolds within the framework of the Princesse Lalla Meryem Pour Enfants Autistes Institute in which ABA and ABLLS programs are used extensively, complemented by individualized support provided by dedicated assistants for each student. Furthermore, cognitive behavioral therapy is integrated into the educational approach. The overarching goal of the organization is to equip children with ASD with the necessary skills to integrate successfully into mainstream educational institutions. By employing a participatory action research methodology, this study engages closely with professionals, parents, and autistic students. Qualitative interviews, observations, and collaborative reflections serve as key methods to understand the nuances and effectiveness of ABA, ABLLS, and cognitive behavioral therapy in fostering inclusivity. Initial findings highlight the pivotal role of individualized support and evidence-based interventions such as ABA, ABLLS, and cognitive behavioral therapy in promoting the inclusion of children with ASD. Insights gleaned from the experiences of both professionals and parents shed light on promising practices and areas for further enhancement in preparing autistic children for successful integration into mainstream educational institutions. This study enriches the existing literature by providing firsthand insights into the practical applications of ABA, ABLLS, and cognitive behavioral therapy within the context of an inclusive educational organization in Morocco. By bridging theory and practice along with incorporating diverse perspectives, the study aims to inform the development of more effective inclusive policies and practices, ultimately contributing to the successful integration of children with ASD into mainstream educational settings.

ARTICLE INFORMATION
ACCEPTED: 01 July 2024  PUBLISHED: 18 July 2024  DOI: 10.32996/ijels.2024.6.3.2

1. Introduction
Children with autism spectrum disorder (ASD) face unique challenges in accessing inclusive educational opportunities. The Princesse Lalla Meryem Pour Enfants Autistes Institute in Morocco stands as a beacon of hope, utilizing Applied Behavior Analysis (ABA), Assessment of Basic Language and Learning Skills (ABLLS), and cognitive behavioral therapy to equip autistic children with the skills necessary for successful integration into mainstream educational institutions. This study explores the effectiveness of these interventions in fostering inclusivity for children with ASD within educational contexts, both locally and internationally.
The primary purpose of this study is to evaluate the process of developing inclusive behaviors in children with ASD by examining the effectiveness of ABA, ABLLS, and CBT. The article will seek to understand the complexities of these interventions and their implications for educational, social, and burnout-related experiences among ASD students through in-depth interviews, observations, and reflexive practice based on working hand-in-hand with professionals who support children with ASD.

1.1 The objectives of the research include the following:
1. Examining the implementation of ABA, ABLLS, and cognitive behavioral therapy within the Princesse Lalla Meryem Pour Enfants Autistes Institute.
2. Investigating the perspectives of professionals and parents regarding the effectiveness of these interventions in fostering inclusivity.
3. Exploring the experiences of autistic students themselves in navigating inclusive educational environments.
4. Identifying promising practices and areas for improvement in preparing autistic children for successful integration into mainstream educational institutions.

This article is structured as follows: Section one will provide a background and the rationale of the study, covering some specific areas that make inclusive education for children with ASD challenging. In the case of this study, it is how they have been organized. The investigation techniques used are qualitative interviews, observations, and collaborative reflections. Based on study results and findings, the effectiveness of ABA approaches based on ABLLS towards inclusivity is presented. A Cognitive Behavioral Therapy (CBT) model to acquire an initial understanding of inclusive education is introduced. Finally, the article concludes with a discussion of the implications of these findings for policy, practice, and suggestions for future research in the field of autism education and inclusion. Through this comprehensive exploration, the article aims to contribute to the advancement of inclusive practices for children with ASD, both locally and globally.

2. Literature Review
2.1 Introduction
Educating children with autism spectrum disorder (ASD) encompasses multiple interventions that require a sophisticated sensitivity to strategies and practices. In this literature review, synthesis is made of select research and theoretical frameworks that serve to paint a picture of the empirical playground upon which inclusive education for children with ASD has transpired, primarily focusing on studies investigating the effectiveness of Applied Behavior Analysis (ABA) and Assessment of Basic Language and Learning Skills (ABLLS) in addition to studies examining cognitive behavioral therapy.

2.2 Theoretical Frameworks
The Social Model of Disability, proposed by scholars such as Oliver (1996), emphasizes the role of societal barriers in disabling individuals with impairments, shifting the focus from the individual to the environment. This framework underscores the importance of creating inclusive educational environments that accommodate the diverse needs of children with ASD.

2.3 Effectiveness of ABA
One of the most widely used interventions for ASD children is Applied Behavior Analysis (ABA). Smith et al. (2000) conducted a meta-analysis of ABA interventions and found significant improvements in communication, social skills, and adaptive behavior among children with ASD. Lovaas et al. (1987) also confirmed that early intensive intervention for kids with ASD had positive outcomes at long-term follow-up in terms of skill attainment and reduction of maladaptive behaviors.

2.4 ABLLS and Individualized Support
The Assessment of Basic Language and Learning Skills (ABLLS) offers a comprehensive framework for assessing and addressing the developmental needs of children with ASD. Bondy and Frost (1994) highlighted the importance of individualized support in promoting the acquisition of language and functional skills among children with ASD, emphasizing the need for tailored interventions that target specific areas of deficit.

2.5 Cognitive Behavioral Therapy (CBT)
CBT has been widely embraced as effective in helping students with ASD cope with the usual behavioral and emotional manifestations. Wood et al. (2015) go further to undertake a systematic review of psychological therapy according to CBT for children diagnosed with ASD and agree with its efficiency in the reduction of anxiety, depression, and disruptive behaviors.

2.6 Conclusion
This literature emphasizes the effectiveness of CBT, Applied Behavior Analysis, Verbal Behavior, and Analysis of Effective Language and Learning programs and other practices that enhance the education of children with ASD. In light of these findings, theoretical
and research-based knowledge turns out to be of use in encompassing strategies that would ensure that children with ASD are offered appropriate care and assistance to enhance their academic, social, and emotional realms within mainstream classes.

3. Methodology
This study employs a qualitative research approach to explore the effectiveness of Applied Behavior Analysis (ABA), Assessment of Basic Language and Learning Skills (ABLLS), and cognitive behavioral therapy in fostering inclusivity for children with autism spectrum disorder (ASD) within educational contexts. Through in-depth interviews, observations, and collaborative reflections, the research seeks to uncover the nuanced experiences and perspectives of professionals, parents, and autistic students themselves.

3.1 Purpose of the study
The primary goal of this research is to investigate the process of fostering inclusivity for children with ASD, with a specific focus on understanding the efficacy of ABA, ABLLS, and cognitive behavioral therapy within educational settings. Additionally, the study aims to identify promising practices and areas for improvement in preparing autistic children for successful integration into mainstream educational institutions.

3.2 Research hypothesis
In the present study, ABA, ABLLS, and cognitive behavioral therapy interventions will be viewed as useful for enhancing the integration of kids with ASD in education settings. The individualized support through ABA, ABLLS, and cognitive behavioral therapy will significantly help the children with ASD in their academic and personal social development. Collaboration between professionals, parents, and autistic students will be integral to the success of inclusive educational practices.

3.3 The population of the study
The study population includes professionals (e.g., educators and therapists), parents of children with ASD, and autistic students themselves. Participants are selected from the Princesse Lalla Meryem Pour Enfants Autistes Institute in Morocco and a private British school in Tangier.

3.4 Research site
Data collection takes place at the Princesse Lalla Meryem Pour Enfants Autistes Institute and the private British school in Tangier, where ABA, ABLLS, and cognitive behavioral therapy interventions are implemented.

3.5 Methodological limitations
Where minority groups are concerned, a limitation of adopting the qualitative approach is that data interpretation is usually influenced by the researcher and, therefore, can be subjective and unrepresentative. However, the generalization of some of the study’s findings could be restricted by issues such as small sample size.

3.6 Data analysis procedure
Data analysis follows a thematic approach involving the identification of recurring patterns, themes, and insights across interviews, observations, and collaborative reflections. Transcribed interviews and field notes are coded and categorized to extract key findings related to the effectiveness of ABA, ABLLS, and cognitive behavioral therapy in fostering inclusivity for children with ASD. Interpretation of findings is guided by the study’s research goals and hypotheses, with an emphasis on providing rich, contextualized insights into inclusive educational practices.

4. Results and Discussion
4.1 Data Collection
The findings of this study are derived from a comprehensive analysis of qualitative data collected through semi-structured interviews, direct observations, and collaborative reflections with professionals, parents, and autistic students. These methods allowed for a rich exploration of the effectiveness of Applied Behavior Analysis (ABA), Assessment of Basic Language and Learning Skills (ABLLS), and cognitive behavioral therapy in fostering inclusivity for children with autism spectrum disorder (ASD) within educational contexts.

4.2 Examples and Situations
4.2.1 Effectiveness of Interventions
Interviews with educators and therapists revealed consistent praise for the effectiveness of ABA, ABLLS, and cognitive behavioral therapy in promoting the inclusion of children with ASD. For instance, one educator described how ABA techniques helped students with ASD improve their communication skills and social interactions, leading to greater participation in classroom activities.
4.2.2 Individualized Support
Parents highlighted the importance of individualized support in addressing the unique needs of their children with ASD. One parent shared how the implementation of ABLLS goals tailored to their child’s specific strengths and challenges facilitated meaningful progress in academic and social domains.

4.2.3 Collaborative Partnerships:
Collaborative reflections involving professionals, parents, and autistic students underscored the significance of collaborative partnerships in fostering inclusive educational practices. Autistic students expressed a sense of empowerment and belonging when actively involved in decision-making processes regarding their educational goals and support strategies.

4.3 Discussion
The findings of this study offer compelling insights into the efficacy of ABA, ABLLS, and cognitive behavioral therapy in fostering inclusivity for children with ASD within educational settings. The consistently positive feedback from professionals, parents, and autistic students highlights the transformative impact of evidence-based interventions tailored to individual needs. In addition, the promotion of a partnership approach highlights the assumption that it is possible to use a more comprehensive framework for implementing effective inclusive education for children with ASD as well as society’s support towards children with disabilities in general. Therefore, engaging autistic students in the decisions being made concerning them goes a long way in ensuring that the autistic students are engaged in the attainment of their true potential of being part of the school system in question.

In conclusion, the results of this study broaden the understanding of how to support all children in the classroom with an emphasis on children with ASD and highlight the significance of further research and implementation toward the achievement of inclusive schools for young learners.

5. Limitations
Despite the important conclusions drawn from this study, it has some limitations that should be recognized. This study is weakened by its dependence on qualitative methodologies and the insufficient sample size for the generalization of its findings. Moreover, the study privileged the perspectives of professionals, mothers, and autistic students involved in some educational settings, which may fail to reflect experiences across various contexts. Furthermore, the subjective nature of qualitative data analysis introduces the potential for bias, requiring careful interpretation and validation of findings. Future research could benefit from employing mixed-methods approaches and larger sample sizes to further explore the effectiveness of interventions and inclusive practices for children with ASD.

Nonetheless, this study enriches the current literature on the provision of inclusive education for children with ASD, providing useful strategies and guidelines for teachers, policymakers, and institutions. From the presented findings, it is possible to consider several recommendations for further research, which will help to develop and enhance the given study, in turn contributing to creating more effective and inclusive practices in learning environments for children with ASD.

6. Conclusion
This study contributes significantly to the understanding of the Impact of Applied Behavior Analysis (ABA), Assessment of Basic Language and Learning Skills (ABLLS), and cognitive behavioral therapy in promoting the integration of students with ASD within school settings. By synthesizing and evaluating the qualitative information gathered from several professionals, parents, and autistic students, this study sheds light on the possibilities of change that come from properly delivering evidence-based intervention based on the individual needs of students with AS.

Findings underscore the importance of collaborative partnerships and individualized support in creating inclusive educational environments that accommodate the diverse needs of children with ASD. By actively involving autistic students in decision-making processes and implementing interventions that address their specific strengths and challenges, educators and practitioners can empower them to thrive academically, socially, and emotionally.

Statements and Declarations
Funding: This research received no external funding
Conflicts of interest: The authors declare no conflict of interest.
Acknowledgments: I would like to express my deepest gratitude to my supervisor, Dr. Najib Slimani, for his unwavering support and trust and to my thesis director, Dr. Anasse Khadija, for her constant encouragement and belief in me. I am also grateful to my dear friend and colleague, Chaimae El Hasnaoui, for her invaluable help and to my family for their endless support and motivation.
