#### Abstract

| ABSTRACT In this paper, we introduced and studied $\delta$-small submodule over prime module. Two concepts are very important namely strongly prime submodule and completely prime submodule. Multiple results led to obtaining a $\delta$-small submodule of a singular, divisible and Bezout module with $R$ is local. Important terms that appeared in this article, together with some terms, produced the submodule that we were interested in.

## 1. Introduction

All rings in this paper are commutative with 1 and all modules with unitary. An $R$-module $\mathcal{M}$ is called multiplication if every submodule $A$ of $\mathcal{M}$, there exists an ideal $J$ such that $A=J \mathcal{M}$ [Singh, 2001]. The prime ideal was extended to module by several researchers. Any proper submodule $A$ of $\mathcal{M}$ is called prime submodule of $\mathcal{M}$ if for each ideals $J$ of $R$ and $A_{1} \leq \mathcal{M}$ such that $J A_{1} \subseteq$ $A$, so $A_{1} \subseteq A$ or $J \mathcal{M} \subseteq A$. A definition of prime module [Ssevviiri, 2011]. Any submodule $A$ of $\mathcal{M}$ is called a completely prime submodule if for every $r \in R, m \in \mathcal{M}$ such that $r m \in A$, so $m \in A$ module in [Ssevviiri, 2013]. A module $\mathcal{M}$ is called pseudo valuation module if $A \leq \mathcal{M}$ is a strongly prime submodule of $\mathcal{M}$. Note that the strongly prime submodule ( $s-p r$-submodule) in [Moghaderi, 2011]. Fractional ideal and fractional submodule with more details in [Abed, 2019]. Any module $\mathcal{M}$ is called singular if $Z(\mathcal{M})=\mathcal{M}$ and non-singular $Z(\mathcal{M})=0$ where $Z(\mathcal{M})=\left\{x \in \mathcal{M}\right.$ : $\left.a n n_{T}(x) \leq_{\text {ess }} T\right\}$ [Kasch, 1982]. Any submodule $A$ of $\mathcal{M}$ is called small $(A \ll$ $\mathcal{M}$ ) if there exists another submodule $B$ in $\mathcal{M}$ such that $A+B \neq \mathcal{M}$ [Leonard, 1966]. Also, $A$ is called $\delta$-small if there exists a nonzero submodule $B$ of $\mathcal{M}$ such that $A+B \neq \mathcal{M}$ with $\mathcal{M} / B$ is a singular module ( $A \ll_{\delta} \mathcal{M}$ ) [Wang, 2007]. Torsion module in and simple module in [Kasch, 1982]. A module $\mathcal{M}$ is called indecomposable if $\mathcal{M}=\{0\}+\mathcal{M}$ [Janusz, 1968]. The module $\mathcal{M}$ is called uniform if every submodule $A$ of $\mathcal{M}$ is essential in $\mathcal{M}$ [Dauns, 1980].

## 2- $S$-pr-submodule:

Definition 2.1: [Ssevviiri, 2011] Any submodule $A$ of an $R$-module $\mathcal{M}$ is called prime if:
i) $\quad A \neq \mathcal{M}$.
ii) $\quad r \in R, m \in \mathcal{M}, r m \in A \Rightarrow m \in A$ or $r \in(A: \mathcal{M})$ such that $(A: \mathcal{M})=\{r m \subseteq A ; r \in R\}$.

Remark 2.2: If $A$ is a prime submodule of $\mathcal{M}$, so ( $A: \mathcal{M}$ ) is a prime ideal of $R$.
Definition 2.3: [Kasch, 1982] Let $\mathcal{M}$ be an $R$-module over integral domain $R$ with quotient field. Then $\mathcal{M}$ is said to be torision free module if $T(\mathcal{M})=0$ where $T(\mathcal{M})$ refere to any torsion elements in $\mathcal{M}$.
Remark 2.4: From [Al-Bahrani, 2017]; $\mathcal{M}_{T}=\left\{\frac{x}{t}: x \in \mathcal{M}, t \in T\right\}$ where $T=R-\{0\}$. Therefore, suppose $R$ has no zero divisors with a quotient field $F$ and $0=T(\mathcal{M})$;

$$
\forall A \leq \mathcal{M} \wedge y=\frac{r}{k} \in F, b=\frac{x}{t} \in \mathcal{M}_{T}
$$

Implies $y b \in A$ if $\exists a \in A \ni r x=s t a$.
Now all the tools became available to present new definition named strongly prime submodule ( $s$ - $p r$-submodule).
Definition 2.5: [Moghaderi, 2011] For all non-zero elements $a, b \in R$ such that $a b \neq 0$ with qutiont field $F$ and $T(\mathcal{M})=0$, we say $A$ is a s-pr-submodule of $\mathcal{M}$, if $y \in F, x \in \mathcal{M}, y x \in A$ implies that $x \in A$ or $y \in(A: \mathcal{M})$.

From [Abed, 2019], fractional ideal (FI) means an ideal $I$ of a finitely generated $Z$-module $Z$ with $I$ is the principal ideal over the ring $R i$; where $i$ represent every maximal ideal in $Z$.

And from [Al-Bahrani, 2017]; any submodule $A$ of $\mathcal{M}$ over the integral domain $R$ is called a fractional submodule if $r A$ is a subset of $\mathcal{M}$. On the other hand; if $A$ is a $s$-pr-submodule, so $\mathcal{M}$ is a prime module. In the next proposition; we utilize two concepts are fractional ideal and fractional submodule $A$ in order to get $A$ is a $\delta$-small in $\mathcal{M}$. But before that, we need to state the following lemma:

Lemma 2.6: Let $\mathcal{M}$ be an $R$-module and let $A$ be a proper submodule of $\mathcal{M}$. If $J$ is a fractional ideal of $R$ and $B$ is a fractional submodule ( $F S$ ) of $\mathcal{M}$ such that $J B \subseteq A$; implies $B \subseteq A$ or $J \subseteq(A: \mathcal{M})$, then $A$ is a $s$-pr-submodule [Al-Bahrani, 2017] and hence $\mathcal{M}$ is a prime module.

Proposition 2.7: Let $\mathcal{M}$ be an $R$ - module. If the following statements are hold:
i) $\quad Z(\mathcal{M})=\mathcal{M}$.
ii) All conditions in lemma 2.6 are hold;

Then $A \ll_{\delta} \mathcal{M}$.
Proof: Assume that condition (ii) is hold. We need to explain how $A$ is $s$ - $p r$-submodule. Suppose that $J$ is a fractional ideal of $R$ and $B$ is a fractional submodule of $\mathcal{M}$. It is clear $A$ is a prime submodule of $\mathcal{M}$. For $b \in F$ and $a \in \mathcal{M}_{T}, b a \in A$. If we put $R b=J$, so a fractional ideal of $R$ and $R a=B$ is a fractional submodule $(F S)$ of $\mathcal{M}$. Then $J B$ subset of $A$ and hence $R a=B$ subset of $A$ or $R b=$ $J$ subset of $(A: \mathcal{M})$. Hence $a \in A$ or $b \in(A: \mathcal{M})$. So $A$ is a $s$ - $p r$-submodule of $\mathcal{M}$ (by definition of strongly prime submodule). Therefore $\mathcal{M}$ is a prime module. But $Z(\mathcal{M})=\mathcal{M}$. Thus $A$ is a $\delta$-small of $\mathcal{M}$ [Al-Bahrani, 2017].

Remark 2.8: The converse of lemma 2.6 is true in general because if $A$ is a $s$-pr-submodule of $\mathcal{M}, a \in B-A$ and $b \in J$, then $b a \in$ $J B$. Also, since $J B$ subset of $A$, a is an element of $\mathcal{M}_{T}-A$ and $b \in F$, then $b \in(A: \mathcal{M})$. Hence $J$ subset of $(A: \mathcal{M})$.

Proposition 2.9: Let $\mathcal{M}$ be a singular $R$-module and let $A$ be a submodule of $\mathcal{M}$. If $A$ is a comparable to each ( $F S$ ) of $\mathcal{M}$, then $A \ll_{\delta} \mathcal{M}$.

Proof: Suppose that an element $b$ in $F ; b=\frac{r}{z_{1}}$ and $a \in \mathcal{M}_{T} ; a=\frac{K}{z_{2}}$. So

$$
b a \in A, a \notin A \wedge b \notin(A: \mathcal{M})
$$

We know $a \notin A$. But $A$ comparable to each (FS) of $\mathcal{M}$. Hence

$$
A \subseteq R a \wedge a b \in R a . S o \in R
$$

Also, $b \notin(A: \mathcal{M})$, Therefore:

$$
A \subseteq b \mathcal{M} \text { and } a b \in b \mathcal{M} \text {. So } a \in \mathcal{M}
$$

$\forall b \in R$ and $a \in \mathcal{M}$, then $b a \in A \ni A$ satisfies all conditions of prime submodule. Then

$$
a \in A \text { or } b \in(A: \mathcal{M})
$$

But this contradiction. Hence $A$ is a $s-p r$-submodule, so $\mathcal{M}$ is a prime module with singular property implies by proposition 2.7; $A \ll_{\delta} \mathcal{M}$.

Remark 2.10: A $s$-pr-submodule not imply $A$ is comparable to each $(F S)$ of $\mathcal{M}$.
Note that, the best example to satisfies Remark 2.10 is the following:

Example 2.11: Suppose that $R=\mathbb{R}$ where $\mathbb{R}$ is Euclidian space So $\mathcal{M}=\mathbb{R} \oplus \mathbb{R}$ and $A=\mathbb{R} \oplus(0)$ is $s$-pr-submodule, but when $a=$ ( 0,1 ), then $R a \nsubseteq A$ and $A \nsubseteq R a$.

Corollary 2.12: If for every $b$ is an element of $F, b^{-1} A$ subset of $A$ or $b \in(A: \mathcal{M})$ where $A$ is a prime submodule of singular module $\mathcal{M}$, then $A$ is a $\delta$-small of $\mathcal{M}$.

Proof: Assume that $b \in F$ and $a \in \mathcal{M}_{T}$. So $b a \in A$. When $b^{-1} A$ subset of $A$, this means

$$
a=b^{-1}(b a) \in A
$$

Otherwise $b \in(A: \mathcal{M})$. Hence $A$ is a $s$-pr-submodule of $\mathcal{M}$. Then $\mathcal{M}$ is a prime module with singularty, So $A \ll_{\delta} \mathcal{M}$.
Note that there is a relationship between $\delta$-small submodule and another concept namely pseudo valuation module. Therefore, we need to study and present pseudo valuation module with some examples.

Definition 2.13: [Moghaderi, 2011] Let $\mathcal{M}$ be an $R$-module and let $A$ be a prime submodule of $\mathcal{M}$. We say $\mathcal{M}$ is a pseudo valuation module if $A$ is a $s$ - $p r$-submodule.

## Remarks and Examples 2.14:

1- A module of rational numbers $Q$ over the ring $Z$ is pseudo valuation and hence any prime submodule $A$ of $Q=\mathcal{M}$ is $s$ $p r$-submodule. So $\mathcal{M}$ is a prime module.
2- The module $Z$ as a $Z$-module is not pseudo valuation module.
Proposition 2.15: Let $\mathcal{M}$ be a singular divisible $R$-module. Then any submodule $A$ of $\mathcal{M}$ is $\delta$-small.
Proof: Assume that $A$ is a prime submodule in $\mathcal{M}$ and let $b=\frac{c}{d} \in K$ where $K$ is a field with $a \in A$. Put $b=0\left(\frac{c}{d}=0\right)$. So b belongs to the ideal $(A: \mathcal{M})$. Suppose that $b \neq 0\left(\frac{c}{d} \neq 0\right)$. So $x \mathcal{M}=\mathcal{M}$. Hence

$$
\exists h \in \mathcal{M} \ni a=c h
$$

But $a \in A$ with $A$ is prime submodule, then $h \in A$ or $c \in(A: \mathcal{M})$. If $c \in(A: \mathcal{M})$ this implies that $\mathcal{M}=c \mathcal{M} \subseteq A$, but this contradiction. Therefore $h \in A$ with

$$
\begin{aligned}
b^{-1} a= & \frac{d}{c} a \\
& =\frac{d}{c} a h \\
& =d h \in A
\end{aligned}
$$

Then $b^{-1} A \subseteq A$ and $A$ is $s$-pr-submodule and hence $\mathcal{M}$ is a prime module. But $Z(\mathcal{M})=\mathcal{M}$, thus $A \ll{ }_{\delta} \mathcal{M}$.
Corollary 2.16: Every injective $R$-module $\mathcal{M}$ with $Z(\mathcal{M})=\mathcal{M}$ is a divisible module and hence any submodule $A$ of $\mathcal{M}$ is $\delta$-small.
Proof: By proposition 2.15.
Corollary 2.17: Every singular uniform module $\mathcal{M}$ over serial Noetherian ring $R$ with $J$ is prime ideal of $R$ has $A \ll_{\delta} \mathcal{M}$.
Proof: Assume $\mathcal{M}$ is a uniform module. Suppose that $x, y \in \mathcal{M}$ with $0 \rightarrow \operatorname{ker}(F) \rightarrow R \oplus R \rightarrow a R+b R \rightarrow 0$ is exact sequence. We have $R$ is Noetherian module ( $a R+b R$ is uniserial), because every uniform module is indecomposable. Hence

$$
a R \subseteq b R \text { or } b R \subseteq a R
$$

Then $\mathcal{M}$ is uniserial $R$-module. But $\mathcal{M}=Z(\mathcal{M})$, so $\mathcal{M}$ is pseudo valuation module ( $A \leq \mathcal{M}$ is $s$ - $p r$-submodule). Then $\mathcal{M}$ is prime module. Now $\mathcal{M}$ is prime module with $Z(\mathcal{M})=\mathcal{M}$, implies that $A \ll_{\delta} \mathcal{M}$.

Corollary 2.18: Every submodule $A$ of Bezout module $\mathcal{M}$ over local ring $R$ is $\delta$-small in $\mathcal{M}$.
Proof: Assume that $x, y \in \mathcal{M}$. We must prove that $x \in y \mathcal{M}$ or $y \in x \mathcal{M}$. There exists $a, b, c, d \in R x(1-a c)=y b c$ and $y(1-b d)$. But $R$ has a unique maximal ideal (local ring). Then $1-a c \in U(R)$ or $a c \in U(R)$ where $U(R)$ is a unit element. If $x=y b c(1-a c)^{-1} y R$ and $\frac{a, c R}{J(R)}$ with $R$ local ring, then $a, c \in U(R)$. Put $d \in U(R)$. So $a d \in U(R)$ and $x=y(1-b d)(a d)^{-1} \in y R, d \in \frac{R}{U(R)}=J(R), 1-b d \in$ $U(R)$ and $y=y, d(1-b d)^{-1} \in y R$. Hence $\mathcal{M}$ is serial module. So $\mathcal{M}$ is pseudo valuation module ( $A \leq \mathcal{M}$ is $s$ - $p r$-submodule). Then $\mathcal{M}$ is prime module with $Z(\mathcal{M})=\mathcal{M}$, implies that $A \ll_{\delta} \mathcal{M}$.

Corollary 2.19: Every distributed artinain module $\mathcal{M}$ over the ring $R$ with $Z(\mathcal{M})=\mathcal{M}$ has submodule $A$ is $\delta$-small of $\mathcal{M}$.
Proof: Clear ; Every distributive artinian module is Bezout module with $Z(\mathcal{M})=\mathcal{M}$ implies that $\mathcal{M}$ has $A$ submodule is $\delta$-small.

## 3- C-prime module :

In this section, we discuss completely prime modules and their interrelations with small property of some submodules.
Definition 3.1: [Ssevviiri, 2011] An $R$-module $\mathcal{M}$ is called prime if $r R m=0$, so $r m=0$ or $a=0 \forall r \in R, m \in \mathcal{M}$.
Definition 3.2: [Ssevviiri, 2013] An $R$-module $\mathcal{M}$ is called completely prime module (c-pr-module) if $r m=0$, so $r \in \operatorname{ann} n_{R}(\mathcal{M})$ or $m=0 \forall r \in R, m \in \mathcal{M}$.

Remark 3.3: If the ring $R$ is commutative, so the two definitions 3.1 and 3.2 are same.
Proposition 3.4: Let $\mathcal{M}$ be a $c$ - $p r$-module. Then $\mathcal{M}$ is a $p r$-module.
Proof: Assume that $\mathcal{M}$ is a $c-p r$-module. Suppose that $r$ belongs to $R$ and $m$ belongs to $\mathcal{M}$ such that $r R m=0$. So $r m=0$. Hence $r m=0$. Thus $\mathcal{M}$ is a $p r$-module. Now it is very important to study the strong and clear relationship between $c$ - $p r$-module and $c$ $p r$-submodule. So that we can use new concepts such as torision-free-module in order to obtain prime module and thus $\delta$-small of any submodule of $\mathcal{M}$. Therefore, we need to present $c$ - $p r$-module by another method. See the following definition.

Definition 3.5: Any $R$-module $\mathcal{M}$ is called $c$ - $p r$-module if $0 \neq A \leq \mathcal{M}$ is a $c$ - $p r$-submodule where $c$ - $p r$-submodule means:
Any submodule $A$ of $\mathcal{M}$ with $R m \subseteq A$ is $c$-pr-submodule if :

$$
\forall r \in R, m \in \mathcal{M} \ni r m \in A \text {, then } m \in A \text { or } r \mathcal{M} \subseteq A \text {. }
$$

Remark 3.6: If $A \leq \mathcal{M}$ is $c$ - $p r$-submodule, so $\frac{\mathcal{M}}{A}$ is $c$ - $p r$-module.
Lemma 3.7: Let $\mathcal{M}$ be an $R$-module. If $\mathcal{M}$ is torsion free module, then it is a $c$ - $p r$-module.
Proof: Assume that $r m=0 \forall r \in R, m \in \mathcal{M}$. If $m=0$; there are nothing. Suppose $m \neq 0$. So from definition of torsion-free-module, $r=0$ and $r m=0$. Thus $\mathcal{M}$ is $c-p r$-module ( $\mathcal{M}$ is $p r$-module).

Lemma 3.8: Let $\mathcal{M}$ be an $R$-module. If $\mathcal{M}$ is simple module with reduced property, then it is $c$ - $p r$-module.
Proof: Assume that $r m=0$. If $m=0$ there are nothing. If $m \neq 0$, so $0=r m \cap<m>=r \mathcal{M} \cap \mathcal{M}=r \mathcal{M}$. Thus $\mathcal{M}$ is $c$-pr-module.
Remark 3.9: Let $R$ be a ring with 1 and let $I$ be an ideal of $R$. If $I$ is $c$ - $p r$-ideal of $R$, then $I$ is $c$-pr-submodule [Ssevviiri, 2013].
Proposition 3.10: Let $\mathcal{M}$ be a singular $R$-module and let $A$ be submodule of $\mathcal{M}$. If the ideal $(A: \mathcal{M})=(A: m), m \in \mathcal{M}-A$, then $A$ is a $c$-pr-submodule of $M$ and hence $\mathcal{M}$ is $c$ - $p r$-module $\left(A \ll_{\delta} \mathcal{M}\right)$.

Proof: Assume that $r m \in A, r \in R, m \in \mathcal{M}$. So $r \in(A: m)$. If $m \in A$ there are nothing. Let $m \notin A$. So $r \in(A: \mathcal{M}) \ni r \mathcal{M} \subseteq A$. Hence $A$ is $c$-pr-submodule. Thus $\mathcal{M}$ is $c$-pr-module and then it is prime module. Therefore $A \ll_{\delta} \mathcal{M}$.

Corollary 3.11: Let $\mathcal{M}$ be a singular $R$ - module and let $A \leq \mathcal{M}$. If for all $r \in R, m \in \mathcal{M}$ with $(r m) \subseteq A$, then $(\mathcal{M}) \subseteq A$ or $<r \mathcal{M}>$ $\subseteq A$ and so A is a $\delta$-small in $\mathcal{M}$.

Proof: Assume that $r \in(A: \mathcal{M})$. Suppose that $m \in \mathcal{M}-A$. So $r \mathcal{M} \subseteq A$. Hence $r m \in A$ with $r \in(A: \mathcal{M})$. If $r \in(A: \mathcal{M})$ and $m \in \mathcal{M}-$ $A$, then $r m \in A$ and $<r m>\subseteq A$. But $r \mathcal{M} \subseteq<r \mathcal{M}>\subseteq A$; because $<\mathcal{M}>\nsubseteq A, m \notin A$. Then $r \in(A: \mathcal{M})$. Hence, by proposition 3.10; $A$ is a $c$-pr-submodule and then $\mathcal{M}$ is $c$-pr-module. Therefore $\mathcal{M}$ is a prime module with $Z(\mathcal{M})=\mathcal{M}$ implies that $A \ll_{\delta} \mathcal{M}$.

Remark 3.12: By the same method of proof proposition 3.10, we can say; if $A_{1}=(A: \mathcal{M})$ is a $c$-pr-ideal of $R$ with $(A: \mathcal{M})=(\overline{0}: \bar{m})=$ $A_{1} \forall m \in \mathcal{M}-A$, so $A$ is $c$-pr-submodule and hence $\mathcal{M}$ is $c$ - $p r$-module ( $\mathcal{M}$ is $p r$-module). Therefore, in the next result, we present the following:

Corollary 3.13: Let $\mathcal{M}$ be a singular module. If the set $\{(A: \mathcal{M}): m \in \mathcal{M}-A\}$ is a singular, the $A<{ }_{\delta} \mathcal{M}, \forall A \leq \mathcal{M}$.
Proof: For all $m \in \mathcal{M}-A ; A_{1}=(A: \mathcal{M})$

$$
\begin{aligned}
& =\cap\{(A: \mathcal{M}): m \in \mathcal{M}-A\} \\
& =(A: \mathcal{M}) \quad \text { (by assumption) }
\end{aligned}
$$

$$
\begin{aligned}
\operatorname{But}(A: \mathcal{M})=\{r & \in R: r m \in A\} \\
& =\{r \in R: r \bar{m}=\overline{0}\} \\
& =(\overline{0}: \bar{m})
\end{aligned}
$$

Where $\bar{m}=m+A$. Suppose that $a_{1} a_{2} \in(A: m), a_{1}, a_{2} \in R, m \in \mathcal{M}-A$. So $a_{1} a_{2} \in A$. If $a_{2} \in(A: m)$, there is nothing. Assume that $a_{2} \notin(A: m), a_{2} m \notin A$, so $a_{1} \in\left(A: a_{2} m\right)=(A: m)$ and then $A_{1}=(A: m) \forall m \in \mathcal{M}-A$ is $c$-pr-ideal. Thus from Remark 3.12; $\mathcal{M}$ is $c-$ $p r$-submodule ( $\mathcal{M}$ is $c$-pr-module) and hence is a prime module. But $\mathcal{M}=Z(\mathcal{M})$. Then $A \ll_{\delta} \mathcal{M}$.

Remark 3.14: Let $(A: F)=(A: \mathcal{M})$ where $F \subseteq \mathcal{M}-A$. If we take $F=\{m\}, m \in \mathcal{M}-A$ with $Z(\mathcal{M})=\mathcal{M}$ then by pro.3.10; A is $\delta$ small of $\mathcal{M}$.

Proposition 3.15: Let $R$ be a ring and $\mathcal{M}$ be singular $R$-module such that $A_{1} \neq R$. If $A_{1}$ is $c$ - $p r$-ideal of $R$, then $A$ is $\delta$-small submodule of $\mathcal{M}$.

Proof: Suppose that $A$ is a $c$ - $p r$-ideal and suppose $\mathcal{M}=\frac{R}{A}$. Assume that $a \in A_{1}, b \in R$. Then $a\left(b+A_{1}\right)=a b+A_{1}=A_{1}$; Hence

$$
A \subseteq(0: \mathcal{M})_{R}
$$

If $c \in(0: \mathcal{M})_{R}$, then $c\left(r+A_{1}\right)=A_{1}, r \in R$. So $c R \subseteq A_{1}$. Since $A_{1}$ is $c$ - $p r$-ideal, then $c \in A_{1}$.Hence $(0: \mathcal{M})_{R}=A_{1}$. then $\mathcal{M}$ is $c$-prmodule if $c \in R$ and $m \in \mathcal{M}=\frac{R}{A_{1}}$ such that $c m={ }_{0}^{-}$then $m=m_{1}+A_{1}$ and $c m_{1} \in A_{1}$. Since $c$-pr-submodule, $c \in A_{1}$ or $m_{1} \in A_{1}$ and hence $c m={ }_{0}$ or $m={ }_{0}$. $\left(\mathcal{M}\right.$ is $c$-pr-module) with $Z(\mathcal{M})=\mathcal{M}$, so $A \ll_{\delta} \mathcal{M}$.

Definition 3.16: [Singh, 2001] An ideal $J$ of the ring $R$ is called insertion of factor property (IFP) is $a b \in J, a, b \in R$, so $a R b \subseteq J$. Therefore a submodule $A$ of $\mathcal{M}$ is called (IFP) if $a m \in A, a \in R, m \in \mathcal{M}$, so $a R m \subseteq A$ and a module $\mathcal{M}$ has (IFP) if the zero submodule has (IFP).

Proposition 3.17: Let $\mathcal{M}$ be an $R$ - module and let $A$ be a submodule of $\mathcal{M}$. If:
i) $\quad Z(\mathcal{M})=\mathcal{M}$.
ii) $\quad A$ has $I F P$ and $p r$-submodule,

Then $A \ll_{\delta} \mathcal{M}$.
Proof: Suppose that $A \leq \mathcal{M}$ is $c$-pr-submodule. So $A$ is prime and has $I F P$. Now we have $A \leq \mathcal{M}$ is a prime with $I F P$. Suppose that $r m \in A$. But $A$ has $I F P, r<m>\subseteq A$. Since $A$ is prime submodule, then $m \in A$ or $r m \subseteq A$. Hence $A$ is $c-p r-s u b m o d u l e$. Then $\mathcal{M}$ is $c$-pr-module ( $\mathcal{M}$ is $p r$-module). But $Z(\mathcal{M})=\mathcal{M}$. Thus $A \leq \mathcal{M}$.

Lemma 3.18: Every maximal submodule with completely semi prime (c-semi-prime) is completely prime submodule (c-prsubmodule) [Dauns, 1980].

Definition 3.19: [Bland, 2011] Let $\mathcal{M}$ be an $R$-module and let $\emptyset \neq \mathcal{M}_{1} \subseteq \mathcal{M}-\{0\}$ is called multiplicative system of $\mathcal{M}$ is $\forall r \in$ $R, m \in \mathcal{M}, H \leq \mathcal{M} \ni(H+<m>) \cap \mathcal{M}_{1} \neq \emptyset$ and $(H+<r m>) \cap \mathcal{M}_{1} \neq \emptyset$, so $(H+<r m>) \cap \mathcal{M}_{1} \neq \emptyset$.

Proposition 3.20: Let $\mathcal{M}$ be a singular $R$-module. If $A$ is a submodule of $\mathcal{M}$ such that $\mathcal{M}-A$ is a multiplication system of $\mathcal{M}$, then $A \ll_{\delta} \mathcal{M}$.

Proof: Suppose that $r \in R, m \in \mathcal{M} \ni<r m>\subseteq A$. But $<m>\nsubseteq A$ with $<r m>\nsubseteq A$. Hence $<m>\cap K=\mathcal{M}-A \neq \emptyset$. Also, $<r m>\cap$ $K \neq \emptyset$. But $\mathcal{M}-A$ is multiplication system, then $<r m>\cap K \neq \emptyset \ni<r m>\nsubseteq A$, contradiction. So $A$ is $c-p r$-submodule. Then $\mathcal{M}$ is $c$-pr-module ( $\mathcal{M}$ is prime module) with $Z(\mathcal{M})=\mathcal{M}$ implies $A \ll_{\delta} \mathcal{M}$.

Corollary 3.21: Let $\mathcal{M}$ be a singular $R$-module and let $K \subseteq \mathcal{M}$ is a multiplicative system of $\mathcal{M}$ such that $A \leq \mathcal{M}$ is a maximal with respect $A \cap K=\varnothing$. Then $A \ll_{\delta} \mathcal{M}$.

Proof: Assume that $r \in R, m \in \mathcal{M} \ni<r m>\subseteq A$. If $<m>\nsubseteq A$ and $<r m>\nsubseteq A$, so

$$
(<m>+A) \cap K \neq \emptyset \text { and }(<r m>+A) \cap K \neq \emptyset
$$

But $K$ is a multiplicative system of $\mathcal{M}$. So $(<r m>+A) \cap K \neq \emptyset$. If $<r m>\subseteq A$ imply $A \cap K \neq \emptyset$, a contradiction. Therefore $A$ is $c$ $p r$-submodule of $\mathcal{M}$. Hence $\mathcal{M}$ is $c$-pr-module. Thus $\mathcal{M}$ is a prime module. But $\mathcal{M}$ is singular module. Then $A \ll_{\delta} \mathcal{M}$.

Corollary 3.22: Let $\mathcal{M}$ be an $R$-module. If:
i) $\quad Z(\mathcal{M})=\mathcal{M}$.
ii) $\quad A \leq \mathcal{M} \ni A$ is $c$-pr-ideal of $R$.
iii) $\quad A \neq R$.

Then $A \ll_{\delta} \mathcal{M}$.
Proof: Suppose that $A$ is $c$ - $p r$-idael and let $\mathcal{M}=\frac{R}{A}$. Clear that $\mathcal{M}$ is an $R$-module. If $a \in A, r \in R$, so $a(r+A)=a r+A=A$. Then $A \subseteq(0: \mathcal{M})_{R}$. Since $a_{1} \in(0: \mathcal{M})_{R}$, then $a_{1}\left(r_{1}+A\right)=A, r_{1} \in R$. Hence $a, R \subseteq A$. But $A$ is $c$-pr-module and hence is prime module. But $Z(\mathcal{M})=\mathcal{M}$. So $A \ll_{\delta} \mathcal{M}$.

Proposition 3.23: Let $\mathcal{M}$ be a singular module. If $\mathcal{M}$ is contained in every non-zero invariant submodule of $\mathcal{M}_{1}$ where $\mathcal{M}_{1}$ is injective hull of $\mathcal{M}$. then any submodule $A$ of $\mathcal{M}$ is $\delta$-small.

Proof: Assume that $0 \neq A \leq \mathcal{M}$. Clear that $\operatorname{ann}_{R}(\mathcal{M}) \subseteq a n n_{R}(A)$. To prove that $a n n_{R}(A) \subseteq a n n_{R}(\mathcal{M})$. Suppose that there exists $m \in \mathcal{M}, r m \neq 0$. If $0 \neq A, \exists 0 \neq b \in A . \pi\left(R b, \mathcal{M}_{1}\right)=\sum \emptyset(R b), \emptyset \in \operatorname{Hom}\left(R b, \mathcal{M}_{1}\right)$. Since $R b \subseteq \mathcal{M} \subseteq \mathcal{M}_{1}$, then $\pi\left(R b, \mathcal{M}_{1}\right)$ is a non-zero submodule of $\mathcal{M}_{1}$. So $\pi\left(R b, \mathcal{M}_{1}\right)$ is an invariant non-zero submodule of $\mathcal{M}_{1}$. Thus by assumption $\mathcal{M} \subseteq \pi\left(R b, \mathcal{M}_{1}\right)$. Hence

$$
\begin{aligned}
& \qquad \exists r_{1}, r_{2}, \ldots ., r_{k} \in R \ni Q_{1}, Q_{2}, \ldots ., Q_{k} \in \operatorname{Hom}\left(R b, \mathcal{M}_{1}\right) \\
& \ni r m=\sum Q_{i}\left(r_{i} b\right) . \text { Thus } \\
& r m=\sum r Q_{i}\left(r_{i} b\right) \\
& \quad=\sum Q_{i}\left(r r_{i} b\right) \\
& \quad=0
\end{aligned}
$$

This contradiction. Then $\operatorname{ann}_{R}(A) \subseteq \operatorname{ann}_{R}(\mathcal{M})$. Therefore $\mathcal{M}$ is a prime module. But $Z(\mathcal{M})=\mathcal{M}$. Thus $A \ll_{\delta} \mathcal{M}$.

## 4. Conclusion

In this manuscript, we study $\delta$-small submodules based on prime modules. We showed the relationship between some submodules, such as singular submodule with completely prime modules, to get a small concept. It is observed that if $\mathcal{M}$ is a singular $R$-module have a completely prime ideal then it is a $\delta$-small submodule of $\mathcal{M}$. Moreover, we introduce that every submodule $A$ of Bezout module $\mathcal{M}$ over local ring $R$ is $\delta$-small in $\mathcal{M}$.

## Statements and Declarations

Funding: This research received no external funding.
Conflicts of Interest: No conflict of interest.
Acknowledgments: I would like to extend my gratitude and thanks to your esteemed journal and the blessed efforts that you provide to students of science and everyone who contributes to its development.
